

## What Cloudpermit's API Can Do for You

Integrating data and services from other software is easy to do with Cloudpermit's API (Application Programming Interface), which allows third-party systems to interact with our platform while speeding up development.

We use a REST API with data in JSON format for secure authentication. Our API is available for all products and currently supports these features:

### Workspaces API:

Query new and changed workspaces and request data by property or workspace ID.

### Attachments API:

Download attachments in a workspace with metadata, upload new versions, and update attachment metadata.

### Inspections API:

Get inspectors' work lists and access all inspections data, including being able to create ad-hoc inspections and inspection results and upload data created on an inspection visit.

### Property API:

Get the attributes by property ID read from the local GIS, and query workspaces that are linked with the property.

### Payments API:

Get bills and fee items for a workspace, and update payment information in Cloudpermit.

## How to Get Started with Cloudpermit API

A contract will be provided for adding API services. If there are special requirements for the integration, our Customer Success and Sales teams can work with you.

You can develop and test your integrations in the training environment before the API is enabled. If you want more information, contact us for technical documentation and help with making the most of our API.
